

# International Commission of the Scheldt (ICS)

## EUROPE-INBO 2015

### *Roundtable 4: Local transboundary implementation of WFD*

22-23 October  
2015

Arnould Lefébure - Secretary general ICS

# EG: Water Framework Directive

2

## BOTH HELPFUL & ANTINOMIC

WFD ⇒ international coordination in transboundary districts

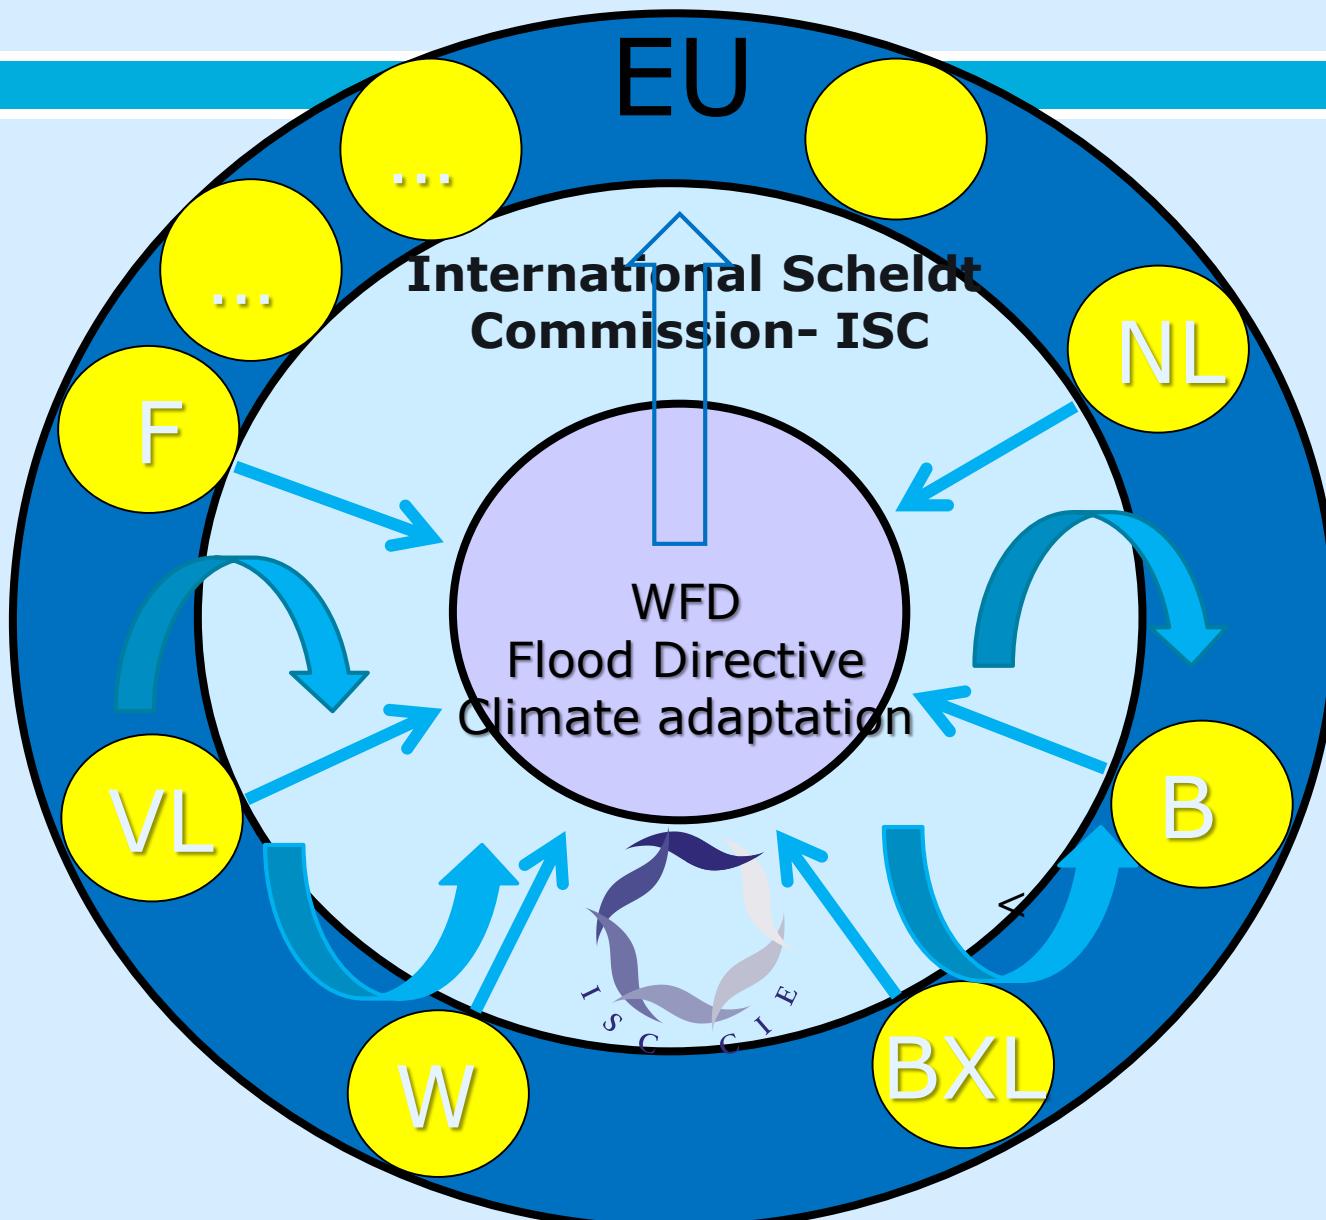

**YET** every member state **reports nationally** to EC (*and not the districts*)

⇒ Implementation of coordination at international level is a **risk**

**WHAT DOES INTERNATIONAL COORDINATION MEAN?**

# EG: WFD – How does it work?

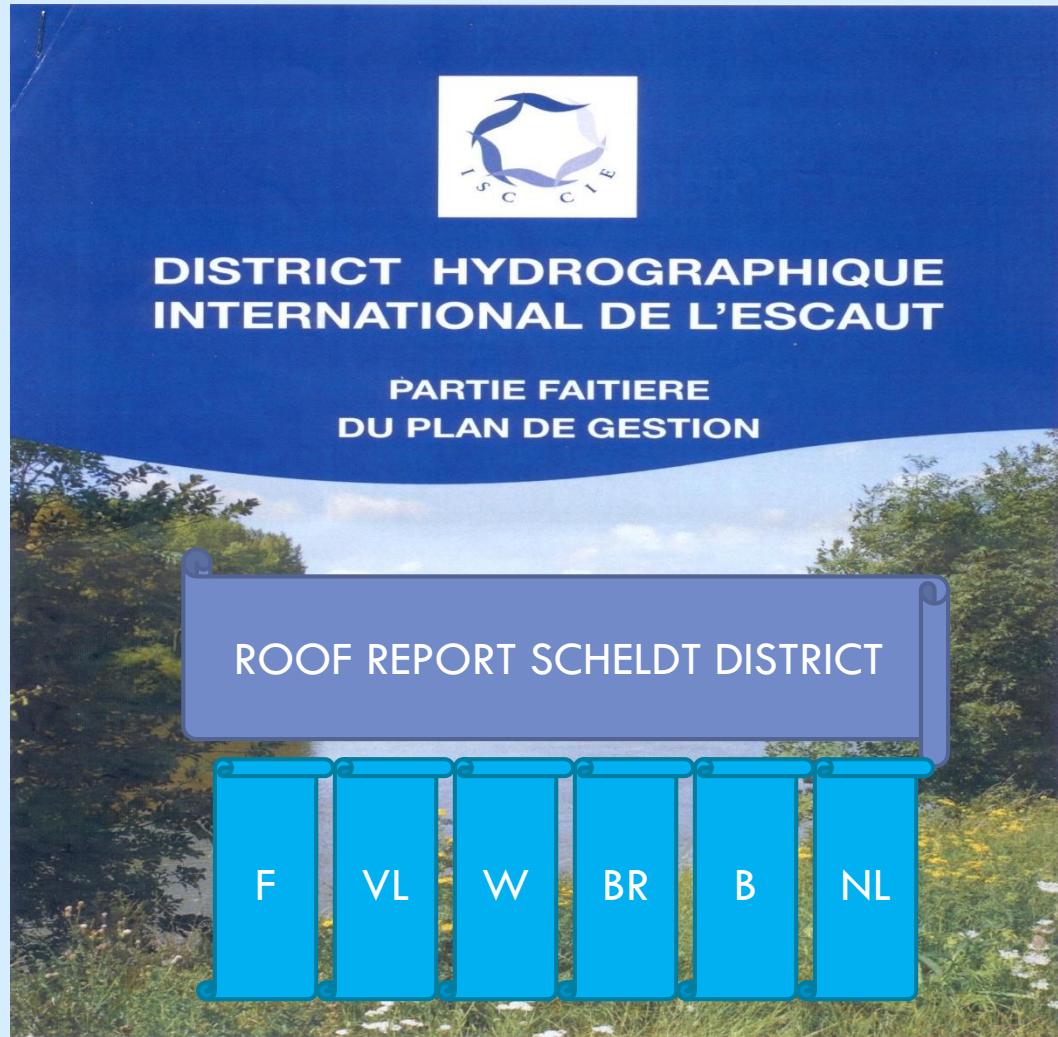

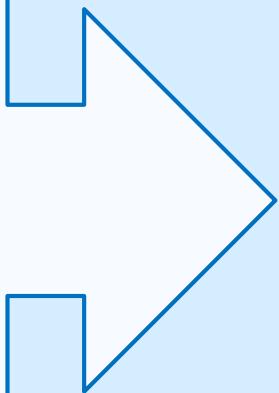

3

# WFD

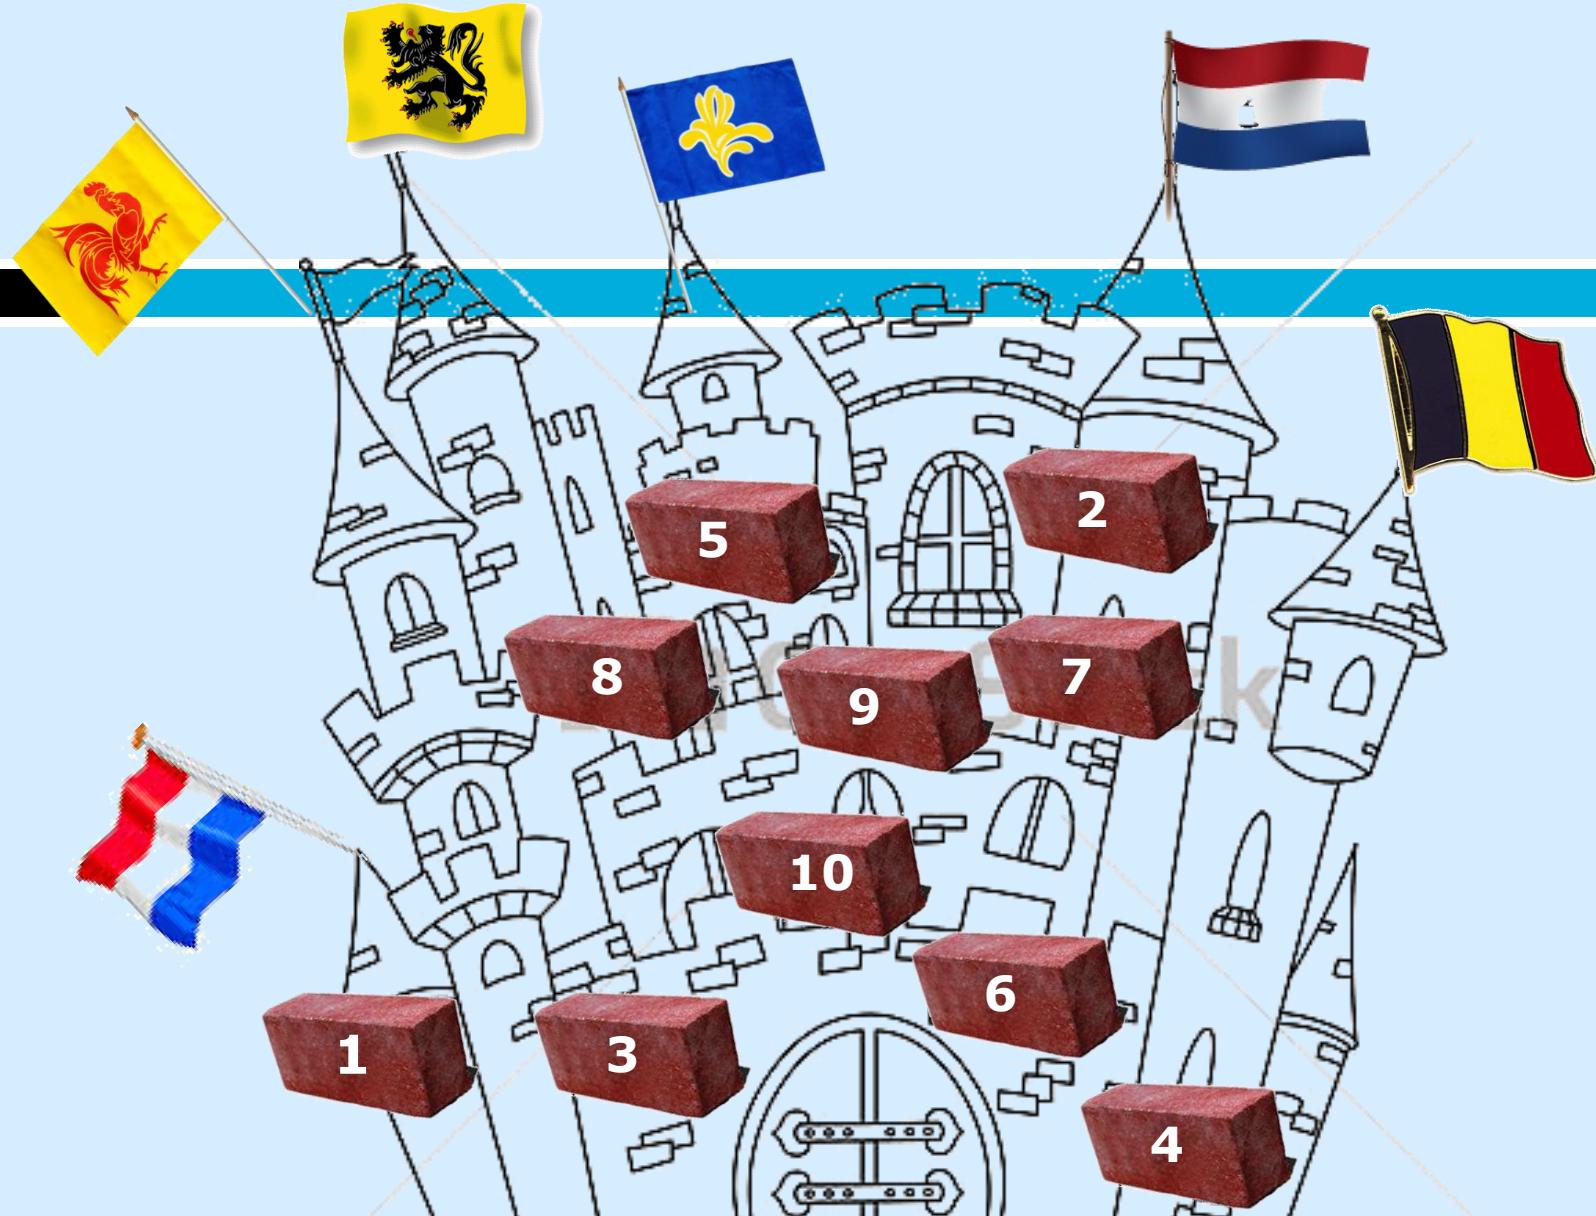

planification to reach  
the **GOOD STATUS**  
(art. 13-15)

**COORDINATION**  
required in the  
international district  
(art.3)

New Roof Report coming up → December 2015

WHAT'S THE MANAGEMENT PLAN SCHELDT?

Cartography / Filing cards transboundary co-ordination fresh surface water, coast- and transition water/ Masterplan Fish/ Three-yearly report water quality/ Memorandum reducing nitrate originating from agriculture/ Filing cards coordination transboundary aquifers/ Economic analysis/ 1<sup>st</sup> strategic memorandum on adaptation to climate change/ Water management matters/ Outline memorandum SARR

# Implementing local transboundary coordination?

6

- In order to get more TRANSBOUNDARY COHERENCE and a better LOCAL TRANSBOUNDARY GOVERNANCE

bilateral standard forms

- Border surface waterbodies
- Transboundary aquifers

# Factsheets for bi- and trilateral coordination of transboundary water bodies

- about 50 factsheets, bilateral or sometimes trilateral

<b>Eaux de transition</b>	FR	WAL	BR	VL	NL
Escaut Maritime / Escaut Occidental				X	X
<b>Eaux douces de surface</b>					
	FR	WAL	BR	VL	NL

Canal Léopold				X	X

# Content of factsheets\_1

- For every transboundary watercourse:
  - Location of the watercourse and of the main **monitoring stations** of the monitoring network
  - **Classification** (big river, stream,...),
  - the **Type** (significantly modified, artificial,..) and the substantiation thereof
  - **Environmental objectives** in force (GEP, EQS, ...) for physical-chemical, chemical and biological aspects
  - **Assessment Status** (2012/2013) in detail of ecological and chemical status (European and specific substances)

# Content factsheets\_2

- For every transboundary watercourse:
  - **Measures**, planned for the watercourse by the different delegations
  - **Objectives 2021/exemptions**
  - Specific items for which **coordination** among delegations might take place
- similarities and differences found are described and analyzed  
=> often additional investigations.

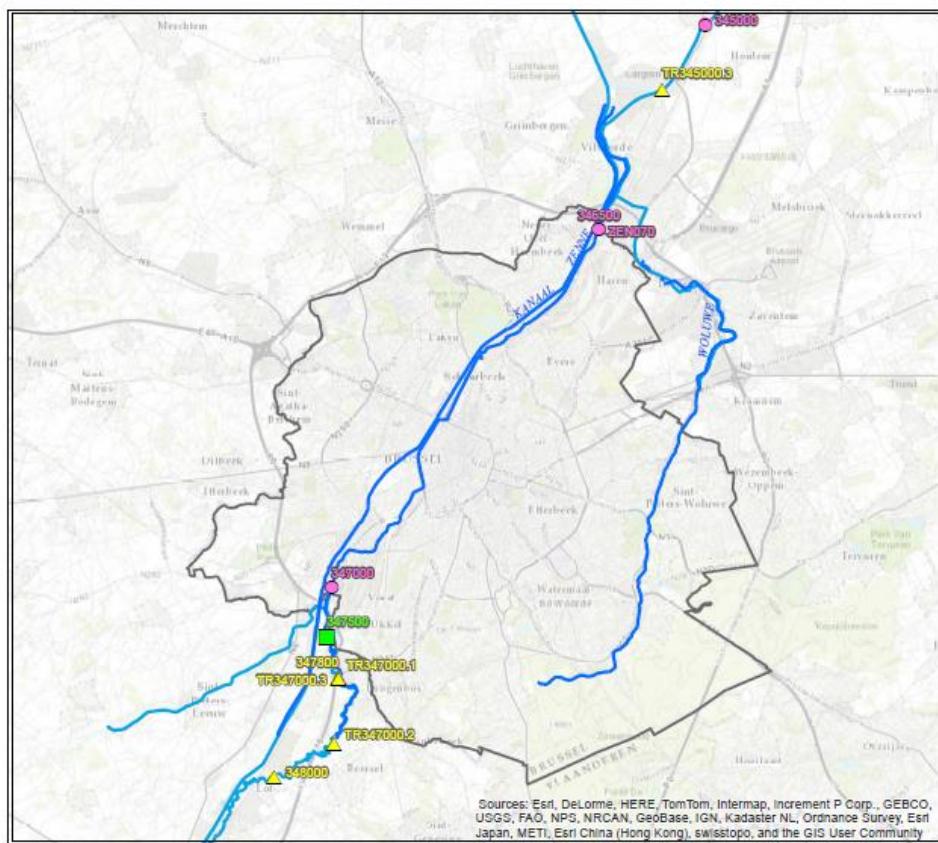

# Content factsheets\_3

Conclusion: the factsheets:

- Tool to get a clearcut understanding of the other delegations' working method = an interesting **working tool**.
- **published in attachment to the RRMP** through the ISC's website.
- Useful to supply info for the various parties' RRMP to be made up.

# Joint maps indicating the location of the monitoring stations

FICHE TRANSFRONTALIÈRE DE LA MASSE D'EAU : ZENNE

- 1 joint map for every factsheet
- locate the transboundary watercourse
- Locate the main measuring points.

# Factsheets\_Main findings\_1

## **Classification:**

- Based on the European directives,
- Noticeably the same for all Parties.
- Difference in reporting to Europe for the smallest watercourses

## **Status – likewise – very few differences found**

# Factsheets\_Main findings\_2

## □ Environmental objectives and status assessment

- Chemical quality – European EQS – few/no differences
- Ecological quality (physical chemistry, biology, specific substances) – numerous differences
  - Intercalibration is not sufficient to eliminate differences
  - The choice of parameters to qualify the physical-chemical quality leads to differences
  - Biological status: calculate an average over several years (WAL, NL, ..) versus using the data of the most recent year (VL, BR) (cf. high variability in biology)
  - Frequency and strategy in monitoring: differences just as well

# Factsheets\_Main findings\_4

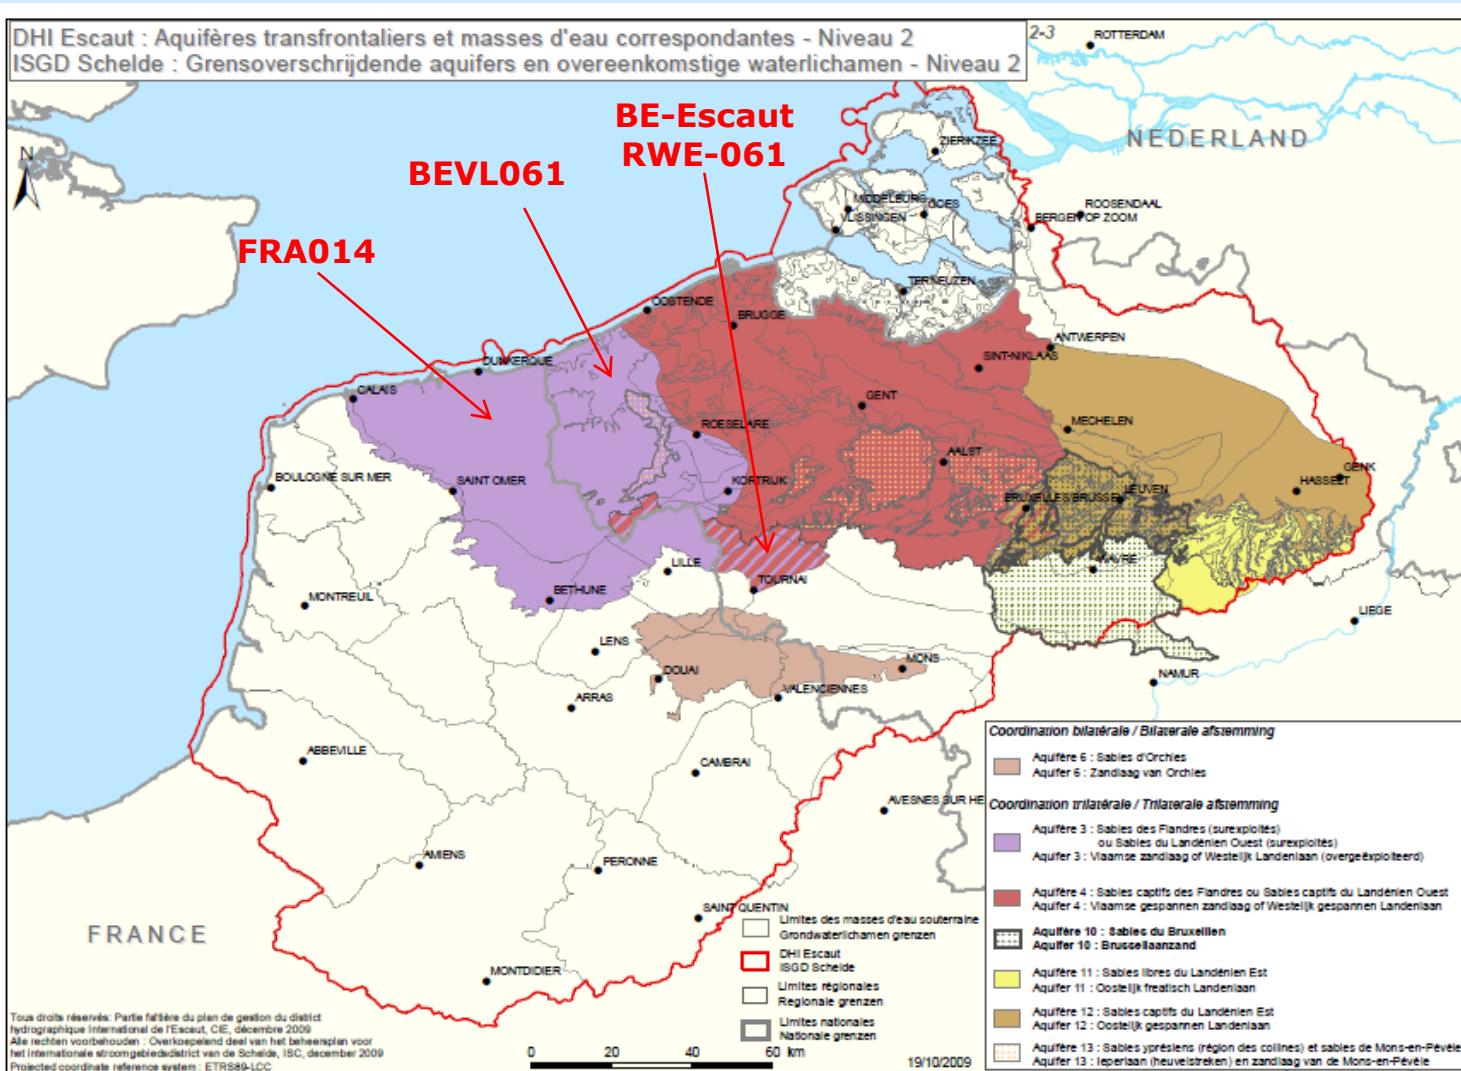

- Overview of the most frequent causes of differences regarding the status assessment
  - differences regarding objectives/comparative frameworks
  - differences regarding monitoring frequency/strategy and measuring precision
  - Structural differences in the watercourse, often more downstream pressure, yet more dilution
- In spite of the numerous (small) (technical) differences in objectives and assessments, the overall appreciation of the watercourse's quality is coherent on both sides of the border.

# Transboundary aquifers: the necessity of coordination

- **22 transboundary aquifers**
- **42 borderline groundwater bodies**

# Transboundary aquifers: the necessity of coordination

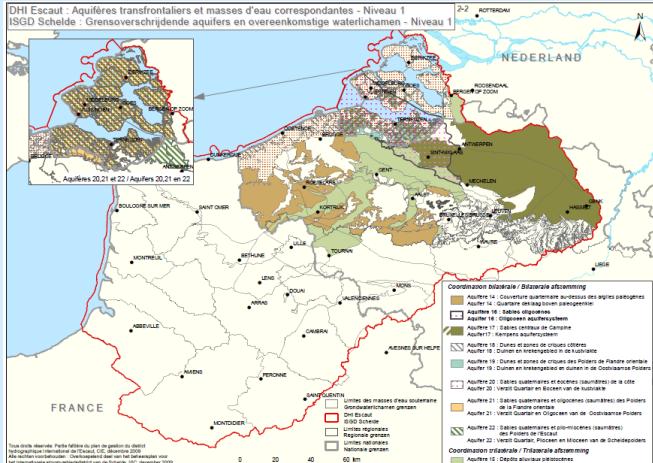

# Transboundary aquifers: the necessity of coordination

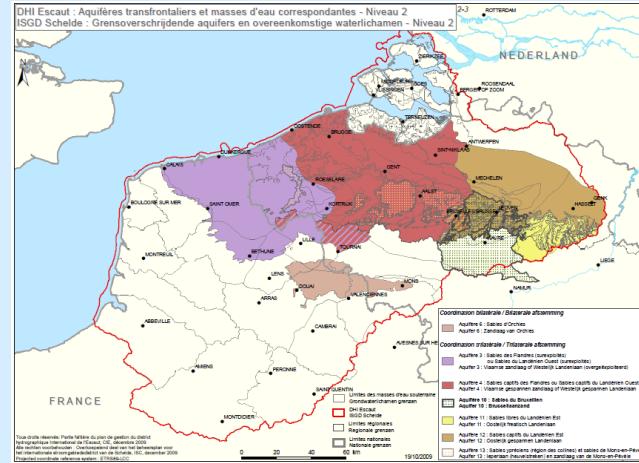

- **22 transboundary aquifers**
- **42 borderline groundwater bodies**
- **Very different geological contexts  
(sand, limestone, ...)**
- **Very different hydrogeological contexts  
(unconfined, captive watertable, ....)**

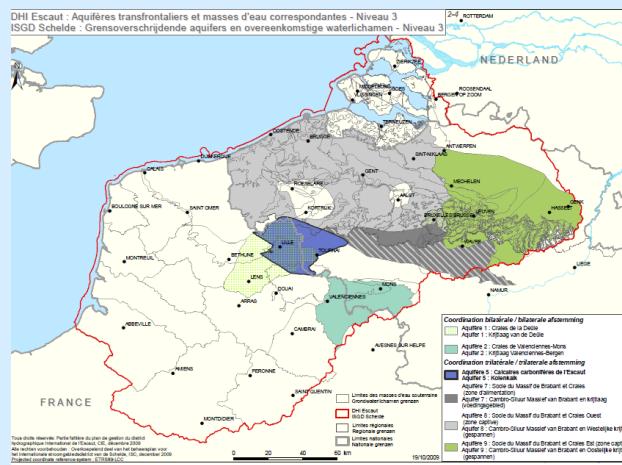

# Transboundary aquifers: the necessity of coordination

**Level 1 : quaternary sand**

**Level 2 : cenozoic sand**

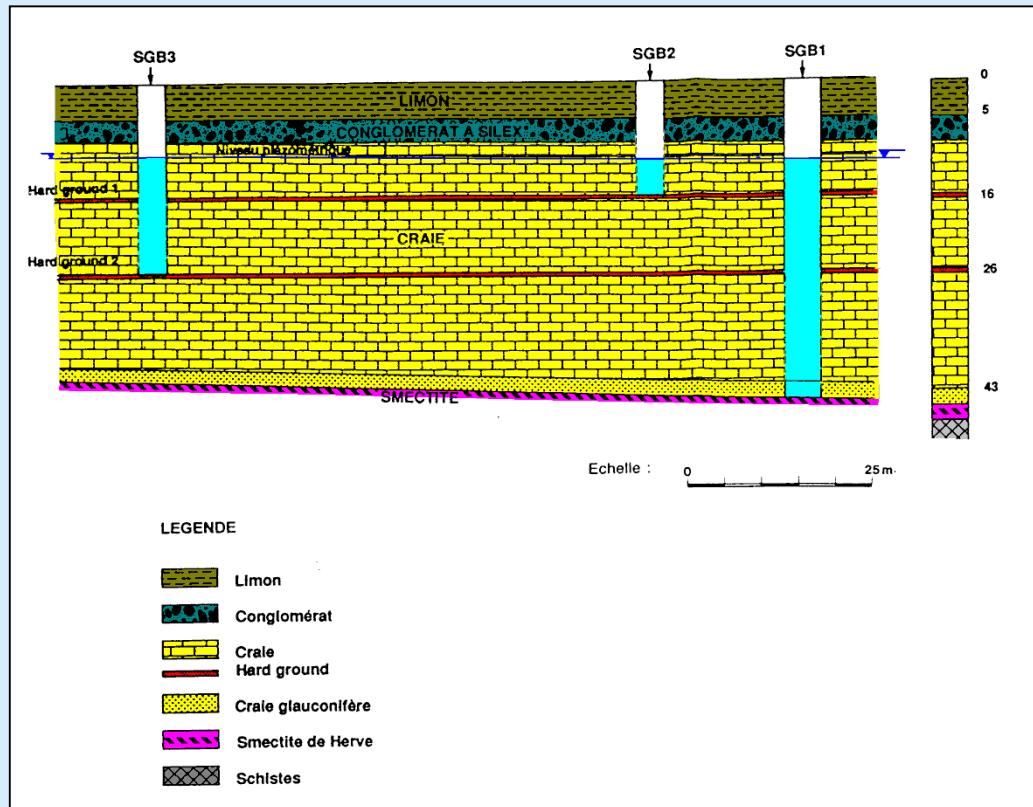

**Level 3 : mesozoic and paleozoic limestone**

# Transboundary aquifers: the necessity of coordination

- **22 transboundary aquifers**
- **42 borderline groundwater bodies**
- **Very different geological contexts  
(sand, limestone, ...)**
- **Very different hydrogeological contexts  
(unconfined, captive watertables, ....)**
- **Specific sampling methods :**  
**(frequency, density, depth,...)**
- **(Slight) disparities among quantitative and qualitative criteria**

# Transboundary aquifers: the necessity of coordination

	NO <sub>3</sub> <sup>-</sup>	Bentazon
0 m	48 mg/l	242 ng/l
16 m	35 mg/l	14 ng/l
26 m	20 mg/l	< 10 ng/l

Example : influence of the sampling depth on qualitative results

# Transboundary aquifers: the necessity of coordination

- **22 transboundary aquifers**
- **42 groundwater bodies**
- **Very geological contexts  
(sand, limestone, ...)**
- **Very different hydrogeological contexts  
(unconfined, captive watertable, ....)**
- **Sampling methods :**  
(frequency, density, depth,...)
- **(Slight) disparities among qualitative and quantitative criteria**

**Conclusion : making of technical bilateral or trilateral factsheets for every transboundary aquifer is a necessity!**

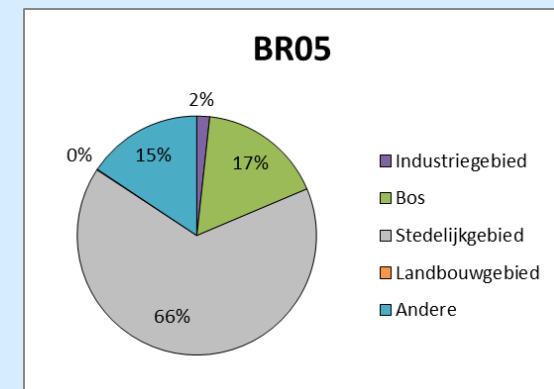

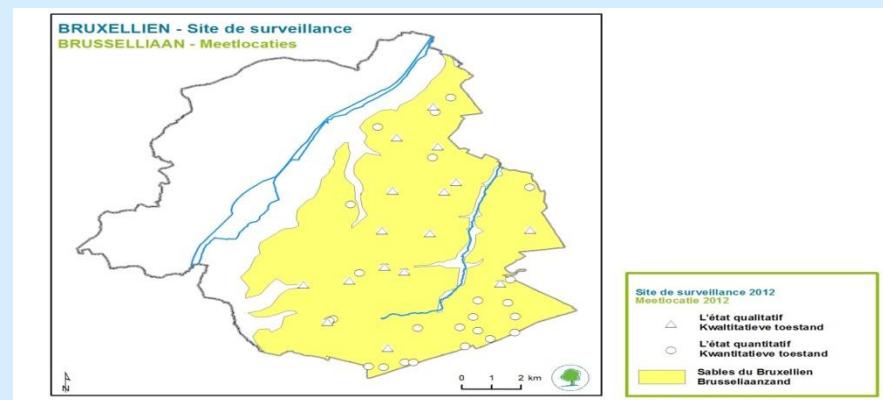

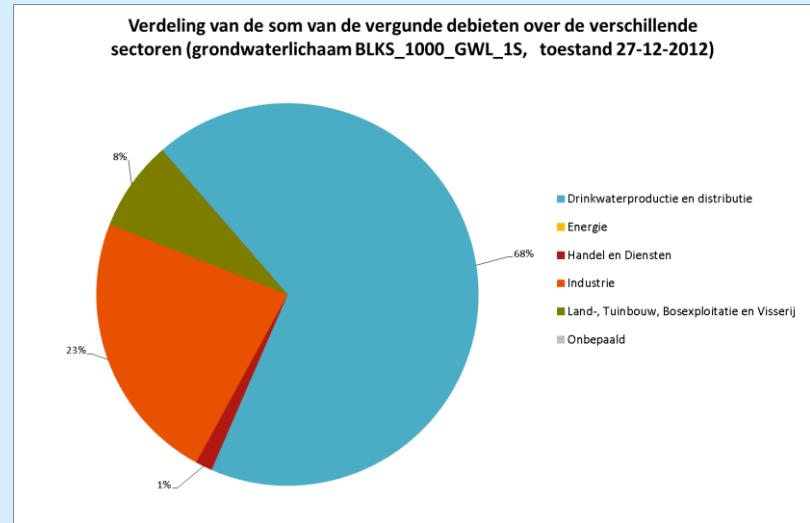

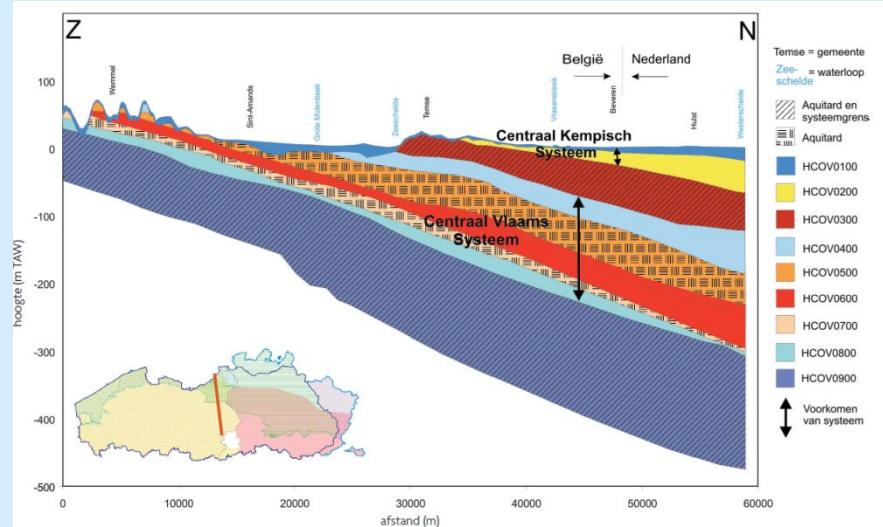

# The making of a technical factsheet

## Content of the factsheets:

1. Identifying the aquifer and the water body
2. Map to locate the aquifer
3. Characteristics of the water body
  - Reference of the water body
  - Land use (pie chart)
  - Quantitative pressure (reference year) :
    - Precipitation, abstracted volumes
    - Monitoring networks
    - Piezometric trends and comments
    - Index of the quantitative status
  - Qualitative pressure (reference year) :
    - Existence of nature-related risks
    - Existence of human risks
    - Index of quality reference parameters
    - Index of the qualitative status
4. Overall status of the water body
  - Overall status and downgrading parameter(s)
5. Objectives Framework Directive (2015, 2021, 2027)
6. Measures put in place

# Making a technical factsheet

# Using the information

- Comparison of rough data
- Comparison of quantitative and qualitative diagnostics
- Comparison « Framework directive » 's objectives
- Comparison of measures put in place

# Using the information

Status of water bodies in transboundary aquifers  
Situation 2012

# Conclusions

- Strive for coherence in data referring to an aquifer
- Analysis of disparities in diagnostics
- Analysis of methodologies
- Discussions based on scientific data
- Justification of disparities
- Standardization of the methods
- difficulty to predict future status
